

- c) storing at least one descrambling key on said at least one SAM module for said authorized user, wherein said descrambling key is adapted to descrambling said data;
- d) assigning a first authorization code to said data;
- e) storing said first authorization code on said at least one SAM module;
- f) encoding a second authorization code on said at least one SAM module using said personal identity code;
- g) storing said second authorization code on said mass storage;
- h) decoding said second authorization code on said at least one SAM module using said personal identity code;
- i) comparing said first authorization code and said second authorization code;
- and
- j) descrambling said data using said descrambling key if said first authorization code matches said second authorization code.

2. A method according to claim 1, further comprising:
transmitting a system certificate from said at least one SAM module to a provider for verification prior to purchasing said data.

3. A method according to claim 1 or 2, further comprising:
transferring a session key to said at least one SAM module for said authorized user, wherein said session key is adapted to a secured transfer of said first authorization code.

4. A method according to claim 1, further comprising:
linking said data to an identification, wherein said identification comprises
personal features of said authorized user.

5. A method according to claim 1, further comprising:
collecting at least part of said personal identity code from said authorized user
using a fingerprint sensor.

6. A method according to claim 1, wherein:
said mass storage is adapted to plugging into a plug-in type module, wherein
said module is adapted to plugging into said replay system.

7. A method according to claim 6, further comprising:
collecting at least part of said personal identity code from said authorized user
using a fingerprint sensor, wherein said fingerprint sensor is adapted to a surface of said
plug-in type module.

8. A method according to claim 1, wherein:
a first SAM module is adapted to communication between said replay system
and a provider of said data, and a second SAM module is adapted to collection of said
personal identity code for storage on said mass storage.

9. A method according to claim 8, wherein:

said mass storage is adapted to plugging into a plug-in type module, wherein said module is adapted to plugging into said replay system, wherein said second SAM module is integrated into a plug-in type module.

10. A method according to claim 1, wherein:

said mass storage comprises a miniaturized hard disk.

11. A method according to claim 1, wherein:

said mass storage comprises a flash semiconductor storage.

12. A method according to claim 11, wherein:

said flash semiconductor storage is adapted to plugging into an interface module, wherein said interface module is adapted to plugging into said replay system.

13. A method according to claim 12, wherein:

said interface module comprises a SAM card reader, wherein said SAM card reader is adapted to receiving said at least one SAM module.

14. A method according to claim 1, wherein:

a remote access to a network is adapted to communication between said replay system and a provider for purchasing said data.

15. A method according to claim 14, wherein:

said replay system comprises a card reader module, wherein said card reader module is adapted to plugging into said replay system, wherein said card reader module comprises a chip card reader and a SAM card reader, wherein said SAM card reader is adapted to receiving said at least one SAM module.

16. A method according to claim 1, further comprising:

at least partially encrypting said descrambling key using said personal identity code; and

at least partially decrypting said descrambling key using said personal identity code.

17. A method according to claim 1, further comprising:

stamping said data with a certified time stamp, wherein said certified time stamp is stored on said mass storage.

18. A replay system comprising:

a read module for receiving data in scrambled form and a first authorization code from mass storage, wherein said mass storage is adapted to plugging into said read module;

a card reader for receiving at least one SAM module for secured access, wherein said at least one SAM module comprises a personal identity code for an authorized user and at least one descrambling key, wherein said at least one SAM module is adapted to
